Sublime is my personal favorite because:

1. First of all, Sublime is a general editor. I can code in any language I like. And certain code editors don't work smoothly or they don't feel good to the eyes, especially on Linux where I work most of the time. Sublime is solid and I don't have to worry about annoying crashes throughout the day. I don't bother to restart it again after a bit of inactivity as performance gets worse over time.

2. Awesome syntax highlighting. Like I said it supports the different file types. I have worked with Notepad++ and visual studio code but somehow I like how sublime has to highlight the dictionaries and classes and everything.

3. Since I am more inclined towards python programming, Sublime is the perfect editor with Python API which allows plugins to augment built-in functionality. Also, the Split Editing allows me to edit files side by side.

Hence, Sublime is the best for me.
